

VISUBILLES bead dosage monitoring unit

You know that the performance of retroreflection of markings is determined by the correct application of glass beads on the strip.

You are interested by the QUALITY of your markings.

You want your work to be more reliable and render monitoring of your marking teams easier.

With Jetlines's VisuBilles :

Install, lift, read, and you obtain :

- The overall consumed dosing
- The useful dosing deposited on the paint strip
- The transverse distribution
- The speed of the machine (optional for COFRAC)

You then quickly make the necessary corrections to improve the quality of application of the glass beads.

An end to dangerous weighing operations which have to be implemented whilst moving, and which only control the average dosing of the glass beads deposited on the marking.
